

# Financials & Supply Chain Archiving

Maximise the efficiency of your business systems  
and ensure optimum performance.

## Key features and benefits

- Improve performance on enquiries
- Archive yet easily access your data
- Efficiently manage the size and growth of your database
- Streamline processes by archiving transactions more frequently

### Manage the size and growth of your database

With TechnologyOne's Archiving modules, transactional information is archived into a separate storage location, replicating minimal database tables and ensuring the archiving database is kept as small as possible.

### Efficient

Financial Archiving enables criteria to be defaulted for different types of ledgers. Supply Chain Archiving enables criteria to be defaulted for purchasing, locations and inventory systems. This means you only need to establish your archive policy once. You can override the archive criteria or disable archiving for individual ledgers locations or systems as required.

### Integrated and intelligent

Data is accessible in both the live and archive databases via a single sign-on and using the same reports and enquiries. Archived data is easily retrieved for the inclusion in individual account transaction listing enquiries and some reports can be customised to provide full access to the archived detail on a read-only basis.

### Future proof

With TechnologyOne you will never be stranded with redundant or inaccessible archive databases. When you upgrade your TechnologyOne Financials and Supply Chain solutions, archiving databases are upgraded independently through a seamless and straightforward upgrade path. Regular and efficient archiving enables quicker software upgrades because they deal with less data, meaning you can more easily keep pace with today's business environment.

### Flexible storage locations

The Archiving module offers the ability to use the same or separate database or servers.

### Minimal replication

Only the relevant database tables are replicated in the archive database, ensuring the archived data is kept to a minimum.

### Financials Archiving

Use Financials Archiving across your financial ledger transactions.

### Supply Chain Archiving
