

# Asset Management eContractorWork

A simple application for smart mobile devices that enables contractors to provide immediate updates on their current assigned work.

- Built on the Ci Anywhere platform
- Available on smart mobile devices
- GIS enabled
- Supports contractors bring your own device (BYOD)

## Key features and benefits

Built on the Ci Anywhere platform, the eContractorWork application allows contractors to easily record and update details of work orders on their smart mobile devices, as soon as the work is completed.

### Monitor Work Status

There is no need to wait for the end of month invoice to know whether work is complete. Work can be continuously assigned to the contractor through monitoring and acknowledging their current workload.

### Mobile Access to Work Orders

Contractors are able to locate, update and complete work orders spatially with embedded mapping capabilities. Contractors can identify possible follow-on work via work requests, and create and complete work orders while on site. The application supports work orders and condition and inspections.

### Asset Inspections

Asset Condition Inspections can be performed by contractors using their own mobile devices.

### Configurable

The application is configurable to allow contractors to re-assign work to a pre-defined list of other contractors or contractor crews. Contractors can also use the application to reject work orders if they are unable to perform the work.

### Secure access

Securely control what work and asset data contractors are able to view and update.

The eContractorWork application allows contractors to:

- Complete work orders
- Update work order information
- Record inspection results
- Re-assign work
- Create new work requests
- Create new work orders
